

## Software Quality Assurance Software Configuration Management

### Software Quality Assurance (SQA)

- a collection of activities "during" sw development
- focus on "increasing the quality" of sw (recall BCFH)
- often conducted by an independent group in the organization:  
often with the final veto over the release of a sw product

### What is Software Quality?

- conformance to explicitly stated functional & performance reqs.

### Software Requirements Specification

### Software Product

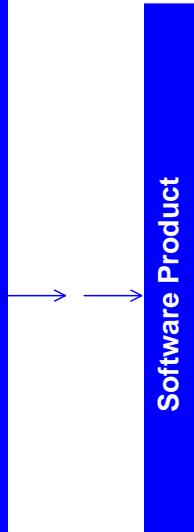

"Software Quality Factors" (broader than performance requirements)

-ilities:  
-ties:

## What is Software Quality?

- conformance to explicitly documented development standards  
*(build the software the right way)*

Software Requirements Specification

"Standards":					
ANSI/IEEE (recall ATM example)					
ISO	.3	6	1.8		
DOD/MIL 2167, Air Force, Navy	.6	5	3.0		
Bell Core (communication)	.1	7	0.7		
Department of Commerce, etc.					
Overall Quality				5.5/10	

- conformance to implicit characteristics expected of all professionally developed sw (*expectation of a reasonable person*)

**Make customer happy!**

Lawrence Chung

## Metrification of Software Quality

- an attempt to provide a quantitative assessment of sw quality
- usual metrification process:

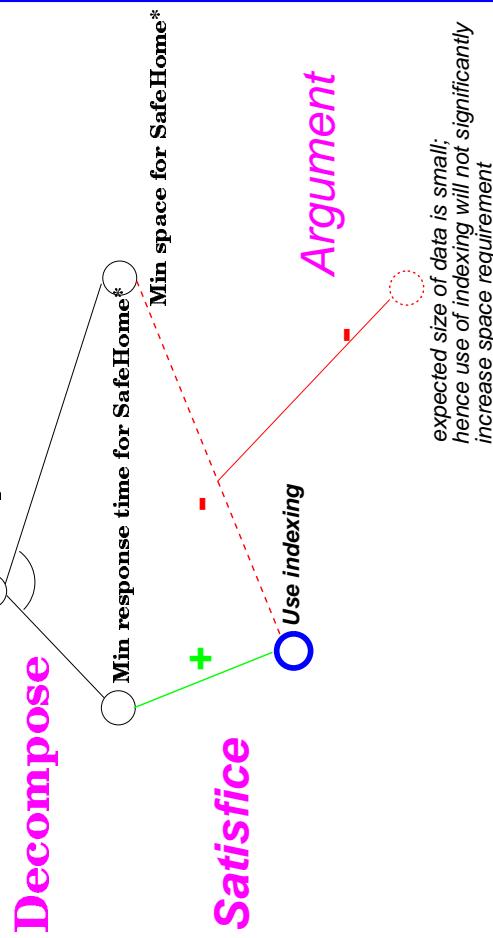

1. determine a set of desirable attributes (i.e., abilities)
2. determine relative importance/weight of such attributes
3. evaluate the quality (rating) of each of the attributes
4. compute weighted rating for each
5. sum up all the weighted ratings

abilities	relative weight	rating	weighted rating
usability	.3	6	1.8
reliability	.6	5	3.0
maintainability	.1	7	0.7
Overall Quality			5.5/10

- an inexact science at this point
- however, aids in understanding the factors that affect sw quality a first-cut approximation very poor quality factor

Lawrence Chung

## Process-oriented approach

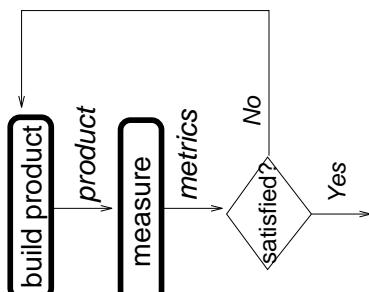

Argument

expected size of data is small;  
hence use of indexing will not significantly  
increase space requirement

Lawrence Chung

## Build Software Quality

**Alas! Infinite design space**

... but are you still trying to find the coin?

Product

usability  
reliability  
maintainability

Process

- clarify
- consider design alternatives
- analyze tradeoffs considering domain characteristics
- record design rationale

Lawrence Chung

## SQA Activities

### Application of technical methods:

analysis, selection & recommendation of CASE tools

L-CASE (e.g., Compiler, Debugger, Pretty Print, ...)

U-CASE (e.g., DFD/SADT/DEF/OO/DD, SC, ...)

I-CASE (e.g., IEF/Composer, Teamwork, System Architect, ...)

Requirements (what, who, when, ...) & selection criteria (supportability)

### Formal technical reviews

organization is similar to Code Inspection (moderator, inspectors, author)  
but usually faster paced (>>150loc) & less intense (>>3lines)  
often primarily to detect errors in a sw design (-> SRS -> SS)

on product, design (low-level, arch.), SRS, SS

### Enforcement of standards

What kind of standards are out there?

Which one to use? (e.g., International, North American, European)

Are standards fixed?

Certification needed?

### Control of change:

no change -> dead/no improvement

changing & conflicting reqs during and after

formal management of changes to the sw and documentation

### Sw measure & reporting mechanisms:

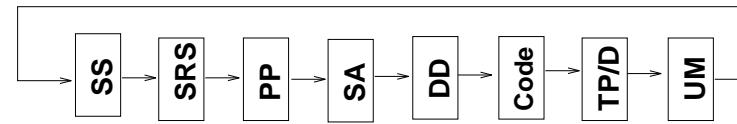

ongoing assessment of sw quality (SRS -> ... -> release)

tracking changes in quality as system evolves (e.g., ver2 << ver1?)

warning mgmt if quality appears to be degrading

### Formal technical reviews

## SQA Activities

## SQA Activities

### ⊕ Purpose of formal technical reviews:

1. accept the product (SS/SRS/Arch..) without further modification
  2. accept the product provisionally; minor errors must be corrected, but no further review
  3. reject the product due to serious errors;
- Once errors are corrected, another review will be performed

### ⊕ Pressman's review guidelines:

review the product not the producer

limit debate and rebuttal

identify problem area but don't attempt to solve every problem

develop a checklist to guide the review process

... and other things you've been doing all along

limit size of review team

require advance preparation ...

train reviewers to review; periodically review the review process

Lawrence Chung

## Software Configuration Management (SCM)

### ⊖ A sw configuration collectively refers to all info. produced as part of the SE process

### ⊖ The First Law of System Engineering:

*No matter where you are in the system life cycle,  
the system will change,  
and the desire to change it will persist throughout the lifecycle*

### ⊖ Purpose of SCM:

*Manage the structure of a sw system over its lifetime  
Bring order to the chaos of a continually evolving sw system*

### ⊖ SCM includes:

- ⊕ System Modeling
- ⊕ System Composition
- ⊕ Version Control
- ⊕ Change Control
- ⊕ Software Release

Lawrence Chung

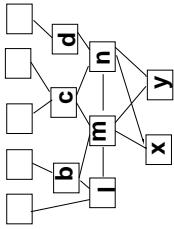

## System Modeling

- then, a **system model** is a complete and detailed description of the client/server relationships in a sw system at a given point

Module x  
op1 (p: int)  
op2

Module y  
k(r: real)  
l(c:boolean)

Module m  
nop1(s:string, h:vector)  
x.op1(i)  
y.k(u,v)  
y.l(t)

*What if algorithms change?*

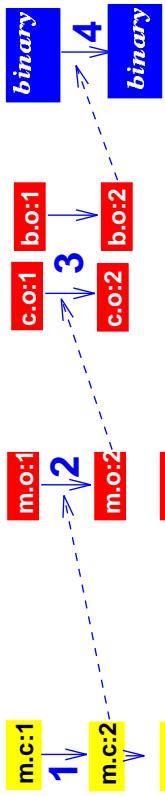

- a sw system is "consistently composed" if for every client/server relationship, the client & the server agree on the interface **between them**
- import/export (private/public) restrictions
- # of parameters
- parameter types
- return type

names

Lawrence Chung

## System Modeling

- assume a sw system is composed of an arbitrary collection of modules, each with a series of versions

- an interface is the link between the server module that provides a service and the client module that uses the service

\* Recall: **data flow**   \* Recall: **operation/service**

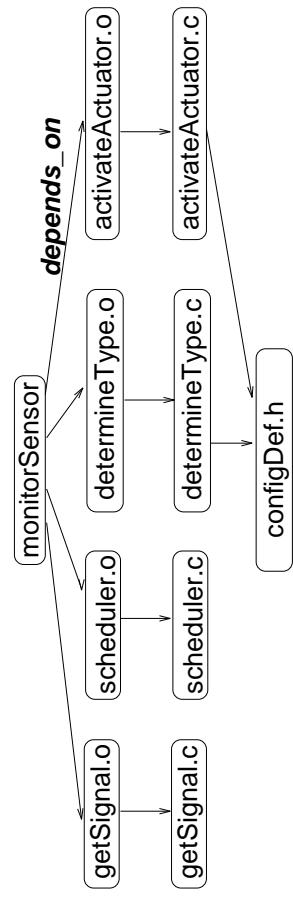

Lawrence Chung

## System Composition Process

### make

- automatic recompilation of modified source code

### Component dependency graph

### drawbacks:

- unnecessary recompilation with comments files instead of abstractions can be complicated to write and understand integration with VCS not adequate

- Module Interconnection Languages are used to express system models containing all of the rules for constructing composite/derived items.

Lawrence Chung

## System Composition Process

### sw architecture

- Input: System Model and sw source/object/binaries

### object modules

- Output: a correctly composed system

### binary modules

- Assume: modules are separately compiled to produce binary modules

A formal "interface" is the only compile time link between client & server modules

- Use the system model to identify the correct binary version for each module  
preferably in terms of sw architecture versions

- For each client/server relationship, check that the client & the server were compiled with the same version

*compiler checks: all imported modules (servers) exist  
all operations invoked by the client exist  
parameters (& types) match*

Lawrence Chung

## Version Control

- a sw sys development involves the creation & evolution of 1000s of configuration objects
- every change to a config. object logically creates a new version of the object => 100s of versions of an object over the lifetime of a system
  - SS
  - SRS
  - PP
  - SA
  - DD
  - TP
  - Code
  - UM
  - PR
- $1000s \text{ of configuration objects} \times 100s \text{ of versions/config-object} = 100,000s \text{ of config-object-versions}$
- any given instance of a sw sys is composed of specific versions of every object in the system
- a version control system combines procedures & tools to manage different versions of configuration objects (e.g., archiving, automatic logging, differential comparison, etc.)

**Do you know why you are working on your SRS now?  
Are there 10 teams working on the same object?**

## Version Control

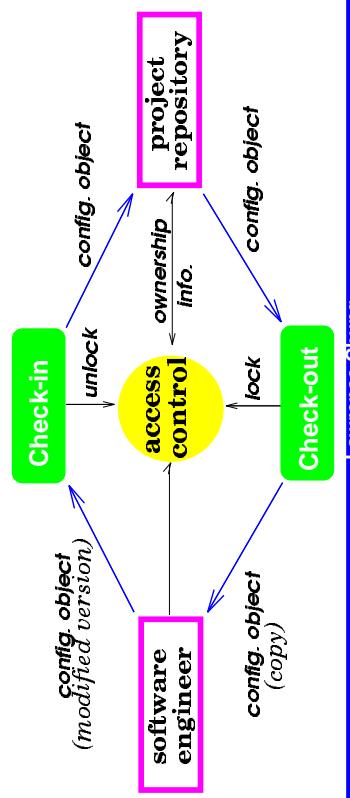

- an "evolution graph" represents diff. versions of a config. object /system
  - ↳ typical naming convention: major.minor.variant  
**relative to the characteristics of sw system**
  - ↳ major versions typically correspond to releases for the sw
  - ↳ minor versions for significant change (e.g., days' work)
- - initial system
  - 1.0
  - lock door
  - 1.1
  - data structure change
  - 1.1.1
  - error correction
  - 1.1.2
  - OS/2
  - turn on lights
  - 1.2
  - algorithm change
  - 1.3
  - error correction
  - 1.4
  - OS/2
  - major enhancements
  - 2.0
  - portability
  - 2.1
  - Windows NT
  - OO
  - 3.0
  - window nesting
  - 3.1
  - Cairo

Lawrence Chung

Lawrence Chung

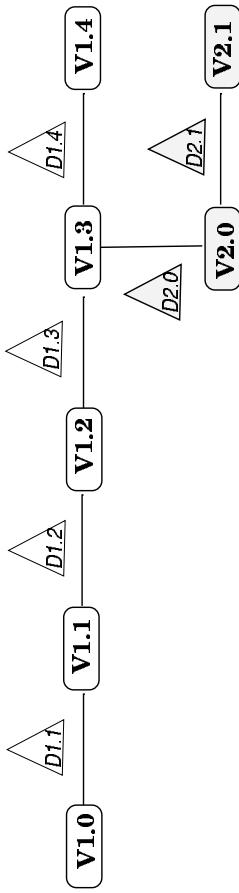

## Change Control

- ☞ change must be "managed":  
 (<-> an empty library, purchase of 100 copies of the same book, etc.)
- ☞ typically a "change committee": senior developers & managers
  - ☒ determines desirability of a change (e.g., control via PDA)
  - ☒ detect conflicting/overlapping changes (e.g., no control via mobile phone)
  - ☒ estimate the cost and impact of changes (e.g., SS, SRS, Proto, SA, DD, Code, TP/TD, UM, ...)
  - ☒ schedule changes relative to software releases
  - ☒ tracks the change process making sure change applications
- ☞ access and synchronization control
  - ☒ access control ensures the sw engineer is authorized to check out
  - ☒ synch. control locks the object at check-out & unlocks at check-in

## Version Management Tools

- ☞ Consider parallel development releases

- ☞ large number of versions -> storage space explosion

- ☒ delta = diff (old version, new version)
- ☒ {version\_i} = version\_master + {delta\_i}

	<b>RCS</b>	<b>SCCS</b>
<b>version_master</b>	version_last	version_first
<b>format</b>	ASCII text	ASCII text
<b>user-supplied info</b>	yes	no

Lawrence Chung
