# Presentation outline

- Test Suite Prioritization
  - Exercise: Prioritize a test suite
- Test Suite Reduction
  - Exercise: Reduce a test suite using HGS
- Discussion

# Test Suite Prioritization

## □ Test Suite Prioritization

- Problem: Given  $T$ , a test suite,  $\Pi$ , the set of all test suites obtained by permuting the tests of  $T$ , and  $f$ , a function from  $\Pi$  to the set of real numbers, the problem is to find  $\pi \in \Pi$  such that  $\forall \pi' \in \Pi, f(\pi) \geq f(\pi')$ . In this definition,  $\Pi$  refers to the possible prioritizations of  $T$  and  $f$  is a function applied to evaluate the order.

## Case Study: Prioritizing User-session-based Test Suites

- Methodology: Convert web logs to user-session-based test suites, prioritize, and write to an XML format.
- Algorithm: Efficiently prioritize by combinatorial-based coverage for large test suites
- Empirical Studies: Families of empirical studies to analyze the effectiveness in relation to characteristics of the applications and test suites.

# Research Questions

- Can we improve the rate of fault detection for user-session-based testing with new prioritization criteria?
- Which techniques are valuable in different scenarios?
  - i.e.: tests have a high/low Fault Detection Density
  - i.e.: predicted distribution of faults (deemed from prior versions of the software)
- Can we fine tune the criteria?
  - i.e.: cost-based prioritization

# Prioritization Metrics

- Test length based on number of base requests:
  - order by the number of HTTP requests in a test case
- Frequency-based prioritization:
  - order such that test cases that cover most frequently accessed pages/sequence of pages are selected for execution before test cases that exercise the less frequently accessed pages/sequences of pages.
- Unique coverage of parameter-values:
  - order tests to cover all unique parameter-values as soon as possible
- 2-way parameter-value interaction coverage:
  - order tests to cover all pair-wise combinations of parameter-values between pages as soon as possible
- Test length based on number of parameter-value:
  - order by number of parameter-values used in a test case
- Random:
  - randomly permute the order of tests

# Empirical Studies

- ❑ TerpCalc, TerpPaint, Terp Spreadsheet, and TerpWord
- ❑ Online Bookstore
- ❑ Online Course Project Manager (CPM)
- ❑ Online Conference Management System
- ❑ SchoolMate
- ❑ Online Music Store
- ❑ Metavist (sponsored by USDA)

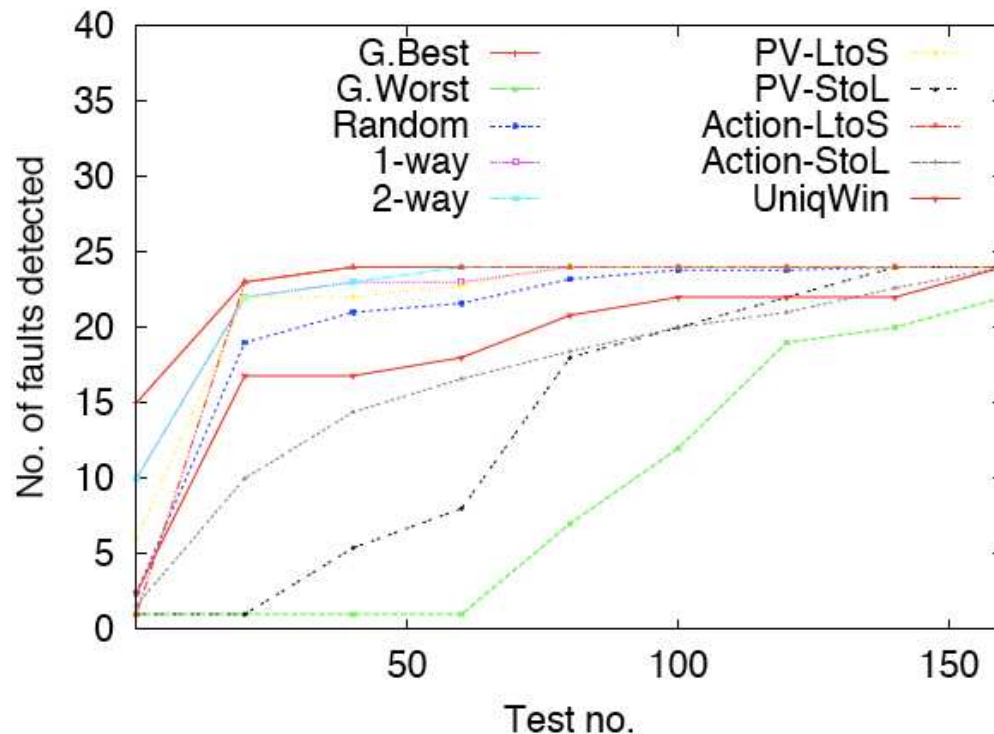

The screenshot shows the "Online BookStore" login page. At the top, there is a navigation menu with links for Home, Registration, Shopping Cart, Sign In, and Administration. Below the menu is a login form with the heading "Enter login and password". The form contains two input fields for "Login" and "Password", a "Login" button, and two lines of text: "guest/guest" and "admin/admin". At the bottom of the page, there are links for "Home", "Registration", "Shopping Cart", "Sign In", and "Administration", and a footer note: "This dynamic site was generated with CodeCharge".

The screenshot shows a web browser window titled "Create New Schedule - Mozilla Firefox". The address bar shows the URL "http://kalinga.sreedevi.net:8000/cpm/servlet/NewSchedServ". The page content is titled "Set up Schedule" and includes a form for setting up a demo. The form has the following fields and options:

- Set up available slots for this demo.**
- Demo Name:** [Text input field]
- Start Date:** February 13 2008
- Stop Date:** February 13 2008
- Start Time:** 9 a.m.
- Stop Time:** 5 p.m.
- Length of Demo:**  Hour  30 minutes
- Web Page Address (Optional):** (Full address of web page containing information about this demo) [Text input field]

At the bottom of the form, there are buttons for "Create Schedule", "Clear", and "Main Menu".

# Results for an on-line system for a Course Project Manager and 890 Test Cases

# Test Suite Reduction

- Problem: Given  $T$ , a test suite with test cases  $\{t_1, t_2, \dots, t_m\}$ , a set of testing requirements,  $\{r_1, r_2, \dots, r_n\}$ , that must be satisfied to provide the desired test coverage of the program, and subsets  $\{T_1, T_2, \dots, T_n\}$  of  $T$ , one associated with each of the  $r_i$  s such that any one of the tests belonging to  $T_i$  satisfies  $r_i$ . Find the *minimal cardinality* subset of  $T$  that exercises all of the requirements exercised by the original test suite  $T$ .

Original Test Suite  
(Too large for our budget)

Reduced Test Suite  
(Fits into budget)

# Reduction Example

- Original Test Suite
  - $\{t_1, t_2, t_3, t_4\}$
- Requirements covered by the test suite
  - $\{r_1, r_2, r_3, r_4\}$
- Problem: Reduce the test suite such that it maintains coverage of these requirements

# Test Suite Reduction Example

T	Requirement	T <sub>i</sub>
1	1	{t <sub>3</sub> , t <sub>4</sub> }
2	2	{ <b>t<sub>4</sub></b> }
3	3	{ <b>t<sub>1</sub></b> , t <sub>2</sub> , t <sub>3</sub> , t <sub>5</sub> }
4	4	{t <sub>1</sub> , t <sub>2</sub> , t <sub>3</sub> }

In this example,  
there are three  
possible solutions.  
We highlighted 1:  
{**t<sub>1</sub>**, **t<sub>4</sub>**}

# Test Suite Reduction Example

T	Requirement	T <sub>i</sub>
1	1	{t <sub>1</sub> , t <sub>5</sub> }
2	2	{t <sub>5</sub> }
3	3	{t <sub>1</sub> , t <sub>2</sub> , t <sub>3</sub> }
4	4	{t <sub>3</sub> , t <sub>6</sub> }
5	5	{t <sub>1</sub> , t <sub>4</sub> }
6	6	{t <sub>1</sub> , t <sub>6</sub> }
7	7	{t <sub>3</sub> , t <sub>4</sub> , t <sub>7</sub> }
8	8	{t <sub>2</sub> , t <sub>3</sub> , t <sub>4</sub> , t <sub>7</sub> }

## HGS Algorithm

3. T<sub>4</sub> is of cardinality 2, there is a tie between t<sub>3</sub> and t<sub>6</sub>, so we look at sets of size cardinality (m+1). We choose t<sub>3</sub>.

Reduced Test Suite:  
{t<sub>5</sub>, t<sub>1</sub>, t<sub>3</sub>}

# Exercise

- Reduce this test suite using the HGS algorithm:

T	Requirement	T <sub>i</sub>
1	1	{t <sub>1</sub> , t <sub>5</sub> }
2	2	{t <sub>5</sub> }
3	3	{t <sub>1</sub> , t <sub>2</sub> , t <sub>3</sub> }
4	4	{t <sub>3</sub> , t <sub>6</sub> }
5	5	{t <sub>1</sub> , t <sub>4</sub> }
6	6	{t <sub>1</sub> , t <sub>6</sub> }
7	7	{t <sub>3</sub> , t <sub>4</sub> , t <sub>7</sub> }
8	8	{t <sub>2</sub> , t <sub>3</sub> , t <sub>4</sub> , t <sub>7</sub> }

# Test Suite Reduction Example

T	Requirement	T <sub>i</sub>
1	1	{t <sub>1</sub> , t <sub>5</sub> }
2	2	{t <sub>5</sub> }
3	3	{t <sub>1</sub> , t <sub>2</sub> , t <sub>3</sub> }
4	4	{t <sub>3</sub> , t <sub>6</sub> }
5	5	{t <sub>1</sub> , t <sub>4</sub> }
6	6	{t <sub>1</sub> , t <sub>6</sub> }
7	7	{t <sub>3</sub> , t <sub>4</sub> , t <sub>7</sub> }
8	8	{t <sub>2</sub> , t <sub>3</sub> , t <sub>4</sub> , t <sub>7</sub> }

## HGS Algorithm

3. T<sub>4</sub> is of cardinality 2, there is a tie between t<sub>3</sub> and t<sub>6</sub>, so we look at sets of size cardinality (m+1). We choose t<sub>3</sub>.

Reduced Test Suite:  
{t<sub>5</sub>, t<sub>1</sub>, t<sub>3</sub>}
