

Lectures #17–18: Typed λ -calculi

CS 6371: Advanced Programming Languages

March 25–27, 2014

There are many typed λ -calculi, of which we will study two. The first is generally referred to as the *simply-typed λ -calculus* or λ^\rightarrow . Here are some of the operations commonly included in λ^\rightarrow .

$e ::= n$	integers
v	variables
$\lambda v : \tau . e$	abstraction
$e_1 e_2$	application
true false	booleans
$e_1 \text{ aop } e_2$	arithmetic ops
$e_1 \text{ bop } e_2$	boolean ops
$e_1 \text{ cmp } e_2$	integer comparison
(e_1, e_2)	pairs
$\pi_1 e$ $\pi_2 e$	projection
$()$	unit
$\text{in}_1^{\tau_1 + \tau_2} e$ $\text{in}_2^{\tau_1 + \tau_2} e$	injection
(case e of $\text{in}_1(v_1) \rightarrow e_1$ $\text{in}_2(v_2) \rightarrow e_2$)	case distinction

The type system for the above language is as follows.

$\tau ::= int$	integer
$bool$	boolean
$\tau_1 \rightarrow \tau_2$	function
$\tau_1 \times \tau_2$	product type
$unit$	unit type
$\tau_1 + \tau_2$	sum type
$void$	void type

$$\begin{array}{c}
\frac{\Gamma \vdash n : int}{\Gamma \vdash n : int} \quad (1) \\
\frac{\Gamma \vdash v : \Gamma(v)}{\Gamma \vdash v : \Gamma(v)} \quad (2) \\
\frac{\Gamma[v \mapsto \tau_1] \vdash e : \tau_2}{\Gamma \vdash (\lambda v : \tau_1 . e) : \tau_1 \rightarrow \tau_2} \quad (3) \\
\frac{\Gamma \vdash e_1 : \tau \rightarrow \tau' \quad \Gamma \vdash e_2 : \tau}{\Gamma \vdash e_1 e_2 : \tau'} \quad (4) \\
\Gamma \vdash \text{true} : bool \quad (5) \\
\Gamma \vdash \text{false} : bool \quad (6) \\
\frac{\Gamma \vdash e_1 : int \quad \Gamma \vdash e_2 : int}{\Gamma \vdash e_1 aop e_2 : int} \quad (7) \\
\frac{\Gamma \vdash e : \tau_1 + \tau_2 \quad \Gamma[v_1 \mapsto \tau_1] \vdash e_1 : \tau \quad \Gamma[v_2 \mapsto \tau_2] \vdash e_2 : \tau}{\Gamma \vdash (\text{case } e \text{ of in}_1(v_1) \rightarrow e_1 \mid \text{in}_2(v_2) \rightarrow e_2) : \tau} \quad (14)
\end{array}$$

$$\begin{array}{c}
\frac{\Gamma \vdash e_1 : bool \quad \Gamma \vdash e_2 : bool}{\Gamma \vdash e_1 bop e_2 : bool} \quad (8) \\
\frac{\Gamma \vdash e_1 : int \quad \Gamma \vdash e_2 : int}{\Gamma \vdash e_1 cmp e_2 : bool} \quad (9) \\
\frac{\Gamma \vdash e_1 : \tau_1 \quad \Gamma \vdash e_2 : \tau_2}{\Gamma \vdash (e_1, e_2) : \tau_1 \times \tau_2} \quad (10) \\
\frac{\Gamma \vdash e : \tau_1 \times \tau_2 \quad i \in \{1, 2\}}{\Gamma \vdash \pi_i e : \tau_i} \quad (11) \\
\Gamma \vdash () : unit \quad (12) \\
\frac{\Gamma \vdash e : \tau_i \quad i \in \{1, 2\}}{\Gamma \vdash \text{in}_i^{\tau_1 + \tau_2} e : \tau_1 + \tau_2} \quad (13)
\end{array}$$

The simply-typed λ -calculus is often extended with an explicit fixed-point operator, sometimes notated with the letter μ as follows.

$$\begin{array}{c}
e ::= \dots \mid \mu v : \tau . e \\
\mu v : \tau . e \rightarrow_1 e[(\mu v : \tau . e)/v] \\
\frac{\Gamma[v \mapsto \tau] \vdash e : \tau}{\Gamma \vdash (\mu v : \tau . e) : \tau} \quad (15)
\end{array}$$

System F [Girard 1972, Reynolds 1974], also known as the *polymorphic λ -calculus*, extends the simply-typed λ -calculus with *type variables*. Valid System F expressions contain no free variables and no free type variables.

$$\begin{array}{ll}
e ::= \dots \mid \Lambda \alpha . e & \text{polymorphic abstraction} \\
& | e[\tau] \quad \text{polymorphic instantiation} \\
\tau ::= \dots \mid \alpha & \text{type variables} \\
& | \forall \alpha . \tau \quad \text{universal types}
\end{array}$$

$$(\Lambda \alpha . e)[\tau] \rightarrow_1 e[\tau/\alpha]$$

$$\frac{\Gamma \vdash e : \tau}{\Gamma \vdash \Lambda \alpha . e : \forall \alpha . \tau} \quad (16) \qquad \frac{\Gamma \vdash e : \forall \alpha . \tau'}{\Gamma \vdash e[\tau] : \tau'[\tau/\alpha]} \quad (17)$$
